SUMMARY

I write in-house Computational Fluid Dynamics (CFD) solvers from governing equations to production code: numerical schemes, parallel computing (MPI, CUDA), CPU/GPU optimization. My work focuses on multiphase turbulence across incompressible and compressible regimes, with applications in ocean engineering, environmental response, public health, and high-energy physics. Now pushing CFD into its next generation by combining quantum computing, AI, and High-Performance Computing (HPC). Also consulting on physics-based AI foundational models and digital twin platforms.

EDUCATION

Peking University 2012 – 2018
Ph.D. in Mechanical Engineering, Fluid Mechanics Beijing, China

- Thesis: Characteristics and action mechanism of the structures in ventilated supercavity

Peking University 2008 – 2012
B.S. in Theoretical and Applied Mechanics Beijing, China

- Thesis: Numerical investigation on heavy particle pair dispersion in the inertial range of two dimensional turbulence

IBM Qiskit Global Summer School on Quantum Machine Learning 2021
Certificate of Quantum Excellence in Quantum Computing and Quantum Machine Learning

- Grade: 100/100

CONSULTING EXPERIENCE

VINCI4D.ai Mar 2026 – Jun 2026
Consultant, Foundational AI Model

- Leveraged AI agentic workflows to develop a scalable, GPU-parallel Computational Fluid Dynamics (CFD) solver with adaptive mesh refinement (AMR) for chip-level thermal analysis.
- Engineered and optimized custom GPU kernels for high-throughput, large-scale parallel thermal simulation.
- Generated high-fidelity training data underpinning a physics-based foundational AI model for semiconductor chip-design customers.

Claros Technologies Jan 2025 – Present
Consultant, Digital Twin Platform

- Built end-to-end CFD digital twin for PFAS chemical reactor with parametric geometry, simulation, data generation, and optimization.
- Integrated chemical kinetics into the solver and developed optimization algorithms for reactive flow design.

DDT (Dynamic Dimension Technologies, LLC) Jan 2023 – Sep 2023
Consultant, Ocean Wave Digital Twin

- Built ocean wave modeling platform (shoaling, bathymetry, vehicle dynamics) with synthetic data generation for surrogate models.

ACADEMIC EXPERIENCE

St. Anthony Falls Laboratory, University of Minnesota Jan 2021 – Present
Researcher Minneapolis, MN

- Built an incompressible CFD solver with AMR, coupled level-set/VOF interface tracking, and cut-cell embedded boundaries on AMReX (26K lines of C++, 12 modules, 467 unit tests, 7 validated benchmarks).
- Ported lab's Fortran HPC code to C++/CUDA multi-GPU. Breaking wave case ($2048\times2048\times1024$): 1 month on 2048 CPUs $\rightarrow$ 2.5 days on 64 A100s $\rightarrow$ under 5 hours with mixed-precision Poisson solver. 40% memory reduction via dynamic memory allocation and custom memory pool.

- Developed hybrid quantum-classical framework (variational quantum circuits + physics-informed neural networks) for incompressible turbulence simulation.
- Applied quantum tensor networks (MPS/MPO) for data compression and acceleration in Navier-Stokes simulations.

St. Anthony Falls Laboratory, University of Minnesota Sep 2018 – Jan 2021
Post-Doctoral Associate Minneapolis, MN

- Developed coupled level-set/VOF interface tracking for two-phase and three-phase flows at high density ratios ($>$1000:1); applied to oil spill simulation in turbulent breaking waves (JCP 2023).
- Simulated COVID-19 airborne transmission in indoor environments; **Featured Article** in Physics of Fluids, covered by The Guardian.
- Researched wind-wave-bathymetry interactions near the surf zone for amphibious vehicle performance.
- Optimized hydro-turbine geometries using immersed boundary methods and large-eddy simulation.

University of Minnesota Sep 2015 – Aug 2017
Visiting Scholar

- Developed in-house code for simulating multiphase turbulent flow with VOF, level set, and immersed boundary methods.
- Researched turbulent cavitating flows interacting with ocean waves.

Peking University Sep 2012 – Jun 2018
Research Assistant Beijing, China

- Built a compressible high-Mach-number multiphase solver from scratch (Fortran + MPI); applied to shock–multiphase-flow interactions for inertial confinement fusion (Physical Review E).
- Developed coupled level-set/VOF interface tracking in an incompressible flow solver; studied underwater cavitation drag reduction (Journal of Fluid Mechanics).
- Investigated Richtmyer-Meshkov instability and turbulent mixing.

RESEARCH INTERESTS

Computational Fluid Dynamics (CFD): High-fidelity numerical simulation (DNS/LES), level set and volume of fluid methods, adaptive mesh refinement (AMR), immersed boundary and cut-cell methods.

Multiphase Flow: Air-water-oil systems, ventilated cavitation, bubble dynamics and tracking, high-density-ratio interface tracking.

Turbulence: Compressible turbulence, turbulent mixing, Richtmyer-Meshkov instability.

High-Performance Computing: Multi-GPU parallel computing (C++/CUDA), mixed-precision solvers, large-scale simulation optimization.

Applied CFD: COVID-19 airborne transmission, oil spill dynamics, hydrokinetic turbine design, aquatic canopy flows, digital twin platforms.

Quantum Computing: Tensor network methods for Navier-Stokes equations, variational quantum algorithms for fluid mechanics, matrix product state encoding.

SKILLS

HPC: Fortran, C++, CUDA, MPI, Python, Git, Slurm, PBS, HDF5, PETSc, hypre.

Multiphase CFD: High-order schemes, interface tracking (level set, VOF, CLSVOF), Basilisk, AMReX, DNS/LES/RANS, turbulence modeling, immersed boundary method, shock capturing, Poisson solver, fluid-structure interaction, finite difference/volume, OpenFOAM, ANSYS.

AI/ML: Physics-informed neural networks (PINNs), LLM-augmented development, multi-agent orchestration.

Quantum Computing: Qiskit, Yao.jl, variational quantum circuits, quantum-PINNs, quantum tensor networks.
